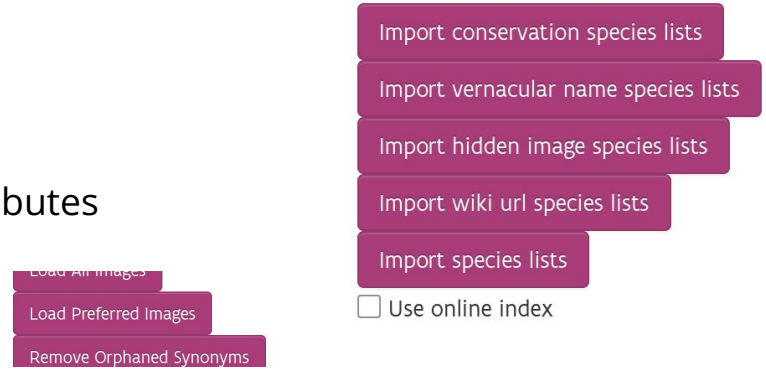
ALA Taxonomic List from Invasive and Biosecurity Lists	Other	Cameron	2023-07-28	2024-01-23	2024-01-23	2648

Need help?

What

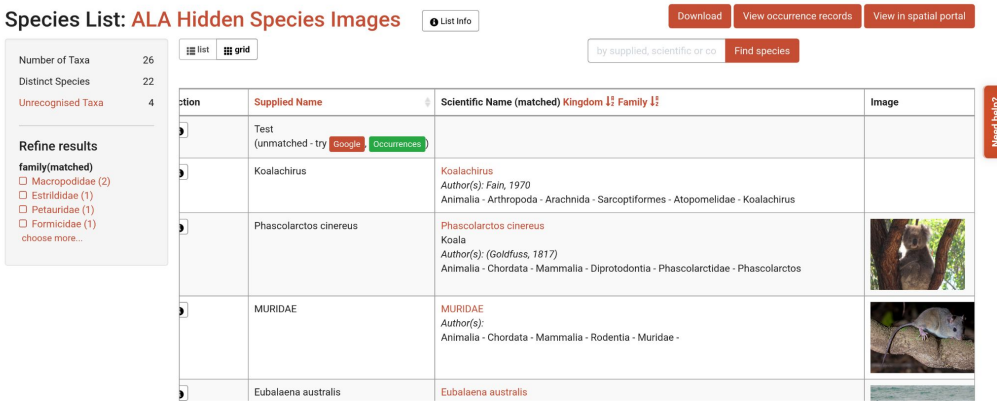
- The (only?) way to provide additional, species-specific, information, on top of the darwin core archive resources:
  - Conservation status
  - Vernacular names
  - (Preferred / Hidden) Images
  - Wikipedia link overrides
  - Additional species characteristic/attributes
  - … ?`



- Consists of a set of (manually?) curated lists, no DwcA involved

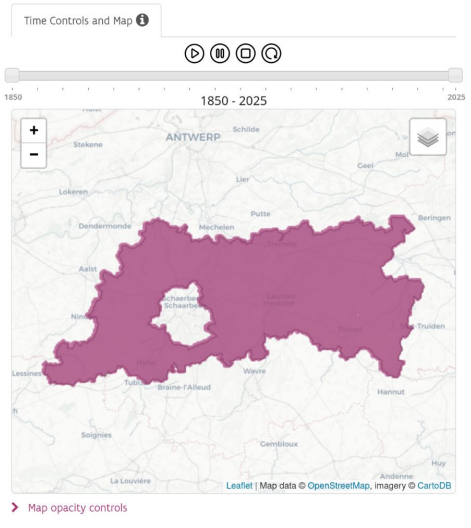
How

- Lists are managed through the UI, or uploaded as a csv
- Column “scientific name” is used to “match” to right species in the atlas taxonomy
- Values become available in the atlas when indexed by the bie-index and pipeline



Changes we made

- Conservation list with time ranges
- WKT / geographic bounds fix?
- Explore by species-list



Questions

- Synced to the collectory? Does that mean we can also use DwcA checklists for conservation status?

- When a new lists is added, do we need to re-index everything?

- Does anyone have experience with automated workflows for maintaining these lists?
